

Decipher vs. Medallia / Qualtrics - The Category Shift

Dimension	Medallia / Qualtrics (Current State)	Decipher (Your Leap)
Core Unit	<i>Driver / Theme</i> — abstract, correlation-based	Experience Driver (ED) — atomic unit, behaviorally precise, emotionally fluent, operationally locatable, semantically stable
Primary Output	Dashboards, reports, heatmaps, alerts	Orchestration Units (OUs) — execution-ready micro-missions, each carrying emotion, stream, and behavioral truth
Execution Model	“Closed loop” = send survey follow-up → route to manager	PDCA Lifecycle — Plan → Do → Check → Act, systematized with problem statements, 5 Whys, initiative scoring, outcome KPIs
Memory	Historical survey results, dashboards archived	Institutional Memory Engine (IME) — every OU and outcome persists as reusable payloads, compounding intelligence
Emotional Measurement	Sentiment, NPS/CSAT correlation, theme importance	Emotional Resonance Index (ERI) — quantified polarity/intensity; Recency-Frequency (RF) urgency; Elasticity proof of emotional response
Temporal Analytics	Trend lines on scores, periodic reports	Longitudinal Quartet — Trend, Momentum, Volatility, Pattern Recognition → temporal DNA of customer emotion
Strategic Context	Theme prioritization, “Top Drivers”	Saturation × Momentum Matrix (25-cell) — execution grammar: urgency codes, owners, trajectory stories
Signal Strength	Importance % (driver regression weightings)	QSSI (Quantified Signal Strength Index) — 0–10 pointer blending trajectory, urgency, stability
Prediction	Forecast survey scores (basic)	PEM (Predictive Emotional Modeling) — foresight: surge, collapse, stabilization, cycles
Derivative Intelligence	None	SG (Silent Guidance), SCE (Silent Cognition Engine), CSLI (Cross-Stream Learning Intelligence) — memory-aware, silence-detection, systemic pattern radar

Payloads	CSVs, BI connectors, API endpoints for survey data. Static extracts that do not persist as reusable assets.	Payload Playground — modular, traceable, versioned payloads (Signal Capsule, OU Payload, PDCA Payload, PEM, Outcome Capsule, SCE, CSLI). Each is composable, injectable into enterprise systems (Salesforce, Palantir, Datadog, Intercom), and fragmentable into micro-insights. Payloads are not reports — they are Lego blocks of emotional intelligence.
Category Position	<i>Customer Experience Analytics</i> — measurement layer	Emotional Infrastructure — operational substrate: emotion in → execution out → memory compounding

From Analytics to Infrastructure: The Decipher Leap

For two decades, CX has been defined by **measurement**. Platforms like Medallia and Qualtrics scaled feedback collection, normalized NPS and CSAT, and gave enterprises dashboards of “drivers” and “themes.”

That was progress, but it stopped short.

A **theme is not a mission**.

A **driver is not an action**.

Dashboards explain what happened but rarely tell teams **what to do, who should act, or how to prove impact**.

◆ Where Medallia / Qualtrics Stop

- **Drivers** → abstract categories like “ease of website” or “delivery speed.”
- **Outputs** → dashboards, heatmaps, alerts.
- **Closed Loop** → survey follow-ups routed to managers.
- **Memory** → historical scores and archived reports.

This is **Customer Experience Analytics** → commentary at scale.

◆ Where Decipher Begins

- **Experience Drivers (EDs)** → the atomic unit of CX: behaviorally precise, emotionally fluent, operationally locatable.
 - **Orchestration Units (OUs)** → micro-missions, each carrying emotion, stream, and behavioral truth.
 - **PDCA Lifecycle** → Plan → Do → Check → Act, with structured problem statements and execution rigor.
 - **Outcome Capsules + IME** → every mission persisted into memory, ensuring no fix is forgotten and no problem is solved twice.
-

◆ **The Leap: From Commentary to Infrastructure**

- **Measurement vs. Action** → Medallia/Qualtrics explain; Decipher executes.
 - **Drivers vs. EDs** → they surface themes; Decipher forges atomic units.
 - **Dashboards vs. Payloads** → they deliver reports; Decipher delivers Signal Capsules, OU Payloads, PDCA Payloads, Outcome Capsules — **reusable, programmable assets**.
 - **History vs. Memory** → they archive; Decipher compounds.
 - **Scores vs. Elasticity** → they track; Decipher proves if action bent emotion.
-

⚡ **Why This Matters**

Enterprises already generate millions of emotional signals daily: surveys, reviews, tickets, silence. Medallia and Qualtrics **collect** them.

👉 Decipher **operationalizes** them.

Emotion in → Execution out → Memory compounding.

That's not analytics. That's **Emotional Infrastructure** - the missing layer of CX.
