

The CX Jobs-To-Be-Done (JTBD) for Modern Enterprises — and How Decipher Bridges the Gap

Goal: expose the **actual jobs** CX leaders hire tools to do, why current approaches leave those jobs unfinished, and exactly how **Experience Drivers → Orchestration Units → PDCA → IME** close the loop.

Executive Summary (1-minute read)

Core job to be done:

“When customers express something (feedback, chat, call, social, survey), help me **know what matters, what to do, who should do it, how to measure it, and how to not lose that learning** — so experience improves, churn drops, and I can prove ROI.”

Where current approaches stall:

- Convert signals to **commentary**, not directives
- Delegate **execution** to human interpretation and meetings
- Provide **point-in-time reports** without memory or reuse

What Decipher adds:

- **Experience Drivers (EDs)**: actionable, emotionally anchored units
- **Orchestration Units (OUs)**: execution-ready micro-missions
- **PDCA with emotion**: disciplined action, scored and verified
- **Institutional Memory Engine (IME)**: outcomes persist and compound

Enterprise definition of success:

- Time from signal → action (days → hours)
 - % signals converted into OUs with owners
 - Outcome proof (pre/post emotion + behavioral change)
 - Memory reuse rate (playbooks reapplied)
 - Churn/retention and cost-to-serve impact
-

1) Define the Jobs (Core, Related, Emotional)

1.1 Core Functional Job

J1. Turn customer signals into enterprise action with proof and memory.

Sub-jobs:

- J1.1 Identify what truly matters now (triage + prioritization)
- J1.2 Translate “themes” into actionable, scoped directives
- J1.3 Route to the right owner with urgency and context
- J1.4 Execute with discipline (plan → do → check → act)
- J1.5 Prove impact (emotion + behavior)
- J1.6 Persist outcomes so wins are reused, not rediscovered

1.2 Related Jobs

- J2 Forecast/monitor risk (silence, surges, pattern recurrences)
- J3 Align with strategy (tie actions to pillars, KPIs, compliance)
- J4 Coordinate across silos (shared language, no re-work)
- J5 Communicate ROI credibly to finance/execs/board

1.3 Emotional/Social Jobs

- J6 Reduce anxiety: *“Are we fixing the right things?”*
 - J7 Establish trust: *“We can show evidence, not opinions.”*
 - J8 Earn influence: *“CX moves from reports to operating system.”*
-

2) Forces & Frictions (Why the Job Stalls Today)

Pushes (why teams seek change)

- Volume and variety of signals outstrip analyst capacity
- “Top drivers” feel abstract; execs demand action + ROI
- Repetition: same issues re-analyzed, not solved

Pulls (what attracts teams to current tools)

- Familiar dashboards, KPIs, benchmarks
- Faster theme surfacing via AI summaries
- Integration checklists and ecosystem comfort

Inertia (why status quo persists)

- “We already have a survey stack”
- Change risk: fear of new operating routines
- Uncertain ownership for cross-team initiatives

Anxieties (risks perceived)

- “Will this become another dashboard?”
- “Will teams actually execute?”

- “Can we quantify impact?”
 - “Will we lose the institutional memory again?”
-

3) How Current Solutions Address (or Miss) the Job

Typical delivery path today:

1. Capture signals → 2) Classify/clusters → 3) Show trends/drivers → 4) Hand off to humans

Where it breaks:

- **Theme → Directive gap:** clusters explain, they don't instruct
- **Ownership gap:** no automatic routing/urgency logic
- **Execution gap:** action planning lives in docs/meetings, not systems
- **Proof gap:** no pre/post emotional and behavioral verification
- **Memory gap:** wins don't persist; fixes aren't reused

Result: the core job remains unfinished. The organization gets **commentary**, not a **closed loop**.

4) Outcome Statements & Metrics (How CX Leaders Judge Success)

- **Reduce** time from first signal to first action by **>50%**
- **Increase** % of high-priority signals converted into owned OUs to **>80%**
- **Verify** emotional shift (e.g., ERI delta) and **behavioral change** (trend/recurrence/momentum) for **>70%** of completed OUs
- **Raise** memory reuse rate (playbooks reused across units/regions) to **>40%** in Q2, **>60%** in Q4

- **Improve** retention in target segments by **2–5 pts** within 2–3 quarters
 - **Lower** cost-to-serve on solved pain points by **10–20%**
 - **Increase** exec confidence (audit-ready outcome capsules) — qualitative but felt immediately
-

5) The Job Map (Ulwick-style) — Step by Step

1. **Define** the unit of action → *Experience Driver (ED)*
2. **Locate** where/when it happens → touchpoint/workflow/surface
3. **Assess** urgency → ERI (emotion), RF (recency/frequency), priority matrix
4. **Decide** what to do → convert ED into an *Orchestration Unit (OU)*
5. **Plan** the mission → structured problem statement + owner + stream (Fix/Optimize/Innovate/Amplify)
6. **Execute** → PDCA with emotional intelligence
7. **Verify** → outcome capsule (pre/post emotion + behavior; elasticity)
8. **Store** → *Institutional Memory Engine (IME)* snapshot
9. **Reuse** → pattern recall; “we’ve solved this before” guidance
10. **Watch silence** → *Silent Cognition Engine (SCE)* flags resolution, disengagement, or missed amplification

In most stacks, steps 1–3 half-happen; steps 4–10 fall to manual effort.
Decipher automates the entire map.

6) How Decipher Finishes the Job (Design Mapped to JTBD)

6.1 Experience Drivers (EDs) → Finish J1.1 & J1.2

- Behaviorally precise, emotionally anchored, operationally locatable

- **XDI Layer 2:** ERI + RF + priority class (clear triage)
- **XDI Layer 3:** behavioral fingerprint (trend, momentum, volatility, patterns)
Outcome: you know **what matters** and **where to act**.

6.2 Orchestration Units (OUs) → Finish J1.3 & J1.4

- EDs spawn **execution-ready micro-missions**
- Structured problem statement (5Ws + “So What”)
- Stream selection (Fix/Optimize/Innovate/Amplify) + owner inference
- **PDCA** embedded; initiatives scored (Impact, Feasibility, Alignment, Risk)
Outcome: you know **who owns it** and **how to act** — with discipline.

6.3 Outcome Capsules → Finish J1.5

- Pre/post **emotional** (ERI) + **behavioral** shift (trend/recurrence/momentum)
- Elasticity rating (durable / at risk / fragile)
- Disposition (Archive / Extend / Branch / Revisit)
Outcome: you have **proof**, not opinions.

6.4 Institutional Memory Engine (IME) → Finish J1.6, J3, J4, J5

- Persists **Signal Capsule + OU + PDCA + Outcome**
- **Pattern recall:** “You solved this in Channel A; reuse for Channel B”
- SCE: detects **silence** on previously hot EDs (resolution vs disengagement)
Outcome: wins **compound**; direction stays **coherent**; reporting to execs/finance is **credible**.

7) Consumption Chain Jobs (Making It Work Day-to-Day)

- **Adopt:** Use EDs as the shared CX unit across teams (no new jargon; familiar “driver,” redeemed)

- **Onboard:** Start with one journey or product line → quick proof
 - **Integrate:** Connect feedback sources; Decipher normalizes to EDs
 - **Operate:** Weekly OU review; PDCA cadence; IME snapshots roll automatically
 - **Expand:** Derivative modules (predictive, cross-stream learning) inherit ED context
-

8) Acceptance Criteria (What Stakeholders Need to Say “Yes”)

- **CX/COO:** “Clear directives, owners, timelines, and proof — not more dashboards.”
 - **Product/Ops:** “Actionable scope, not abstract asks; PDCA embedded.”
 - **Data/IT:** “Integrates with our sources; no fragile custom taxonomies.”
 - **Finance:** “Outcome capsules tie to ROI; audit-ready.”
 - **Compliance:** “If vertical augmentation is on, risk/comms constraints baked into DO/CHECK.”
-

9) Anti-Jobs (What Decipher Is Not)

- Not another **reporting** layer
 - Not a **consulting** framework you re-implement every quarter
 - Not a **taxonomy** you maintain manually
 - Not a **generic AI** summarizer without ownership or proof
-

10) Before/After — The CX Operating Reality

Before (today):

- Signals → themes → slides → meetings → partial action → lost learning
- “Top drivers”: explain scores, don’t direct fixes
- Same issues rediscovered; memory lives in people, not systems

After (with Decipher):

- **Emotion in → ED → OU → PDCA → Outcome → IME → Reuse → SCE**
 - Signals become **missions** with owners and clocks
 - Proof is automatic; memory compounds; speed to impact accelerates
-

11) KPIs & Proof Plan (90-Day, 180-Day)

First 90 days (one journey or product line):

- ↓ Time signal→action by **50%**
- ≥ **70%** high-priority EDs converted into OUs with owners
- ≥ **60%** OUs with verified pre/post emotional shift
- 3–5 reusable **playbooks** persisted in IME

By 180 days (2–3 journeys):

- Memory reuse ≥ **40–60%** of similar missions
 - 2–5 pt improvement in retention for targeted segments
 - 10–20% reduction in cost-to-serve for solved pain points
 - Executive reporting shifts from commentary → outcome capsules
-

12) Objections & Reassurances (Pre-emptive)

- **“We already have a survey stack.”**
Keep it. Decipher **redeems drivers** by making them execution-grade (EDs),

not replacing your stack.

- **“Will this add workload?”**

It **replaces** manual interpretation and meetings with **OUTs** and **PDCA**. Less debate, more doing.

- **“How do we ensure it’s not ‘another AI tool’?”**

The test: Does it produce **owned missions, proof, and memory**? If not, it’s a dashboard. Decipher does.

- **“How will finance buy it?”**

Outcome Capsules are audit-ready: pre/post emotion, behavior, elasticity, disposition — tied to KPIs.

13) Clean Story Spine You Can Use Anywhere

1. **The job:** Turn signals into action, with proof and memory
 2. **Why it fails today:** commentary, not directives; action without discipline; no memory
 3. **The fix:** EDs → OUTs → PDCA → IME (closed loop)
 4. **Proof:** faster action, verified outcomes, compound memory
 5. **Result:** CX shifts from **reporting** to **infrastructure**
-

Final Line (the one to remember)

Other tools summarize what customers say.

Decipher tells you what to do, executes it with discipline, proves it worked, and remembers — so you never have to solve the same problem twice.
